

VULNERABILITY ASSESSMENT REPORT

Target Website

<https://www.wikipedia.org>

Prepared By: Akula Ashrith

Internship

Future Interns - Cyber Security Internship

Date: June 2026

1. Objective

The objective of this assessment is to perform a passive vulnerability assessment on a public website using security tools and identify security-related observations without conducting any intrusive testing.

2. Scope

- Public website assessment only
 - No exploitation performed
 - No brute-force testing
 - No active attacks conducted
 - Read-only assessment
-

3. Tools Used

1. Nmap
 2. SecurityHeaders.com
 3. OWASP ZAP
 4. Google Chrome
-

4. Methodology

The assessment was performed using the following steps:

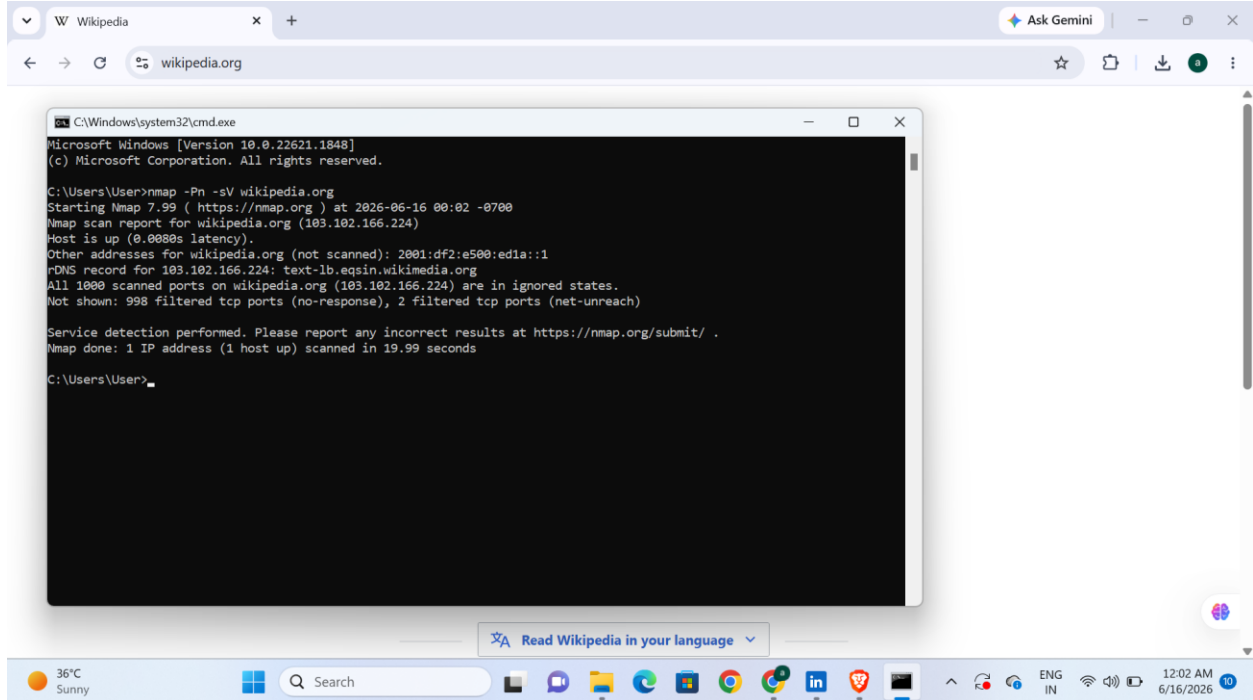

1. Website reconnaissance
 2. Network and service enumeration using Nmap
 3. Security header analysis
 4. Passive security review using OWASP ZAP
 5. Documentation of observations
-

5. Evidence Collected

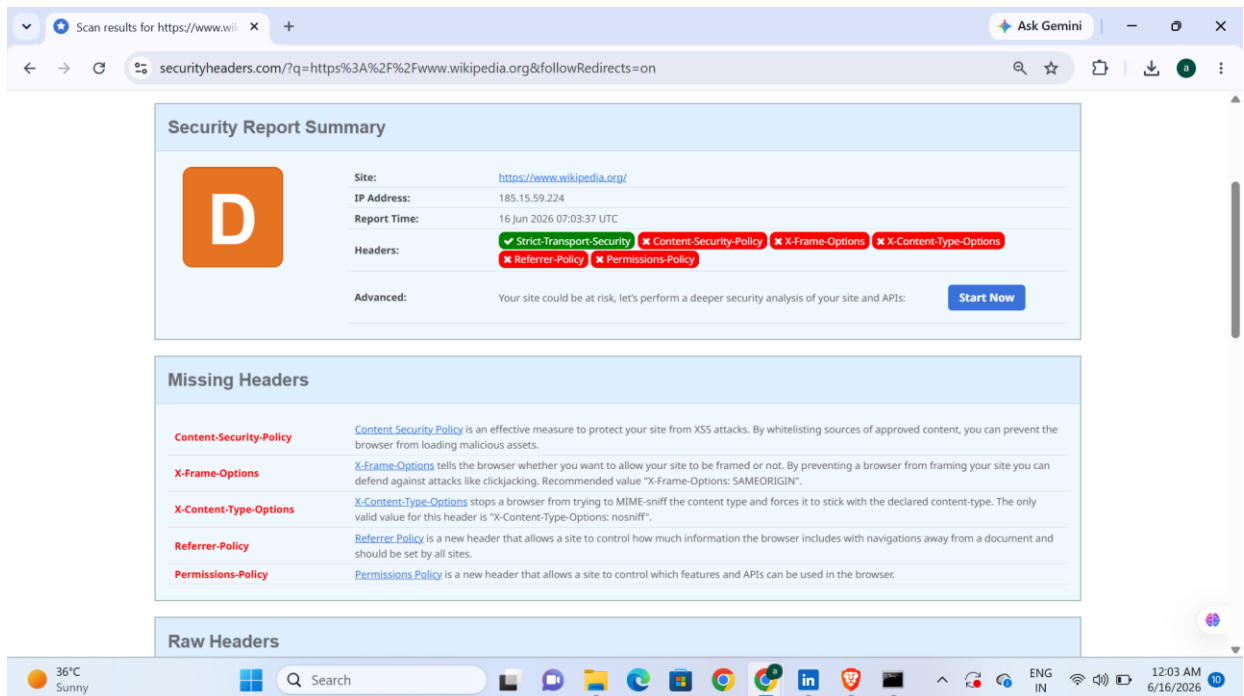

Screenshot 1: Homepage

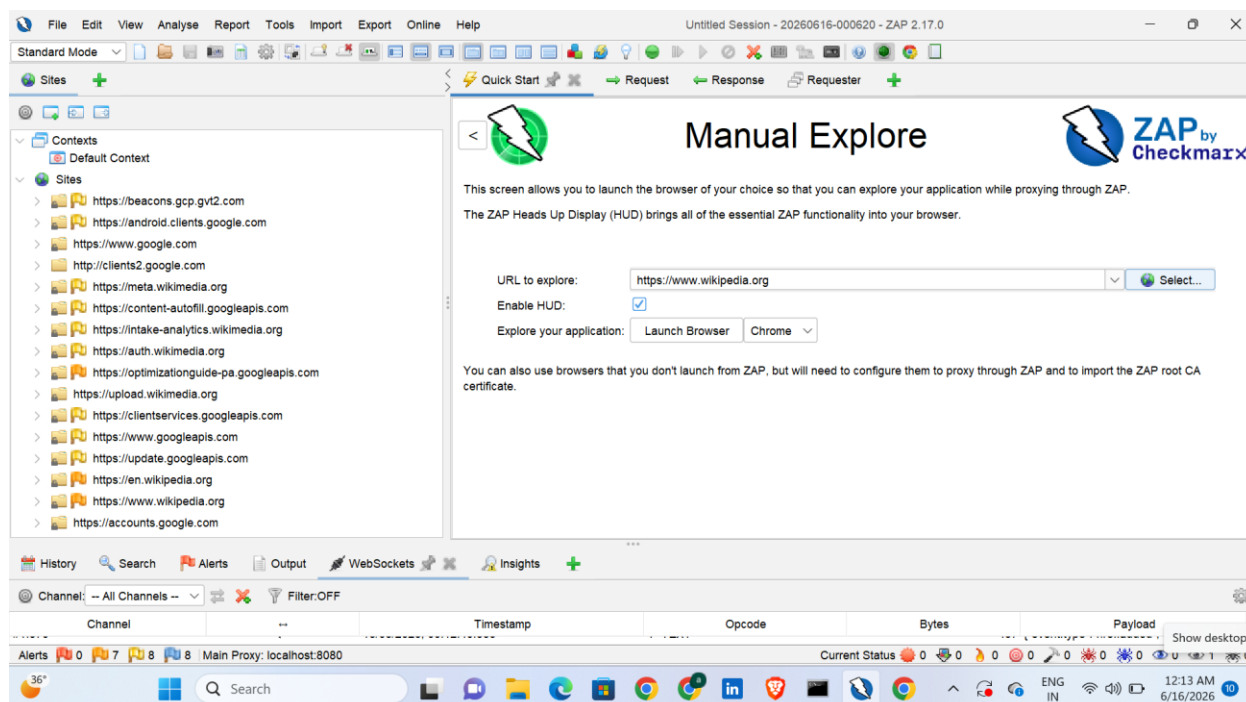

Screenshot 2: Nmap Scan Results

Screenshot 3: Security Headers Analysis

Site Tree :

6. Findings

Finding 1: Network Exposure Assessment

Command Used:

```
nmap -Pn -sV wikipedia.org
```

Observations:

- The target host was reachable.
- DNS resolution was successful.
- Security filtering mechanisms were observed.
- No publicly exposed services were identified during the scan.

Risk Level: Low

Recommendation:

Continue maintaining firewall filtering and access-control mechanisms to reduce unnecessary exposure.

Finding 2: Security Header Review

Observations:

- Security headers were reviewed using SecurityHeaders.com.
- Security headers help protect websites against common browser-based attacks.
- The website demonstrates the use of security-related configurations.

Risk Level: Informational

Recommendation:

Continue maintaining and regularly reviewing security header configurations.

Finding 3: Passive Security Assessment

Observations:

- Passive analysis was performed using OWASP ZAP.
- No intrusive testing was conducted.
- Website responses were reviewed for security-related observations.

Risk Level: Informational

Recommendation:

Perform regular security assessments and monitoring to maintain a strong security posture.

7. Conclusion

A passive vulnerability assessment was performed on the Wikipedia website using industry-standard security tools. The assessment included network enumeration, security header analysis, and passive review activities. No intrusive testing was conducted. The observations indicate that security controls are implemented to reduce exposure and improve overall security.
